⚠️ WARNING!

This manual provides critical safety instructions on the proper setup, operation, maintenance and service of this machine/equipment.

Failure to read, understand and follow the instructions given in this manual may result in serious personal injury, including amputation, electrocution or death.

The owner of this machine/equipment is solely responsible for its safe use. This responsibility includes but is not limited to proper installation in a safe environment, personnel training and usage authorization, proper inspection and maintenance, manual availability and comprehension, application of safety devices, blade/cutter integrity, and the usage of personal protective equipment.

The manufacturer will not be held liable for injury or property damage from negligence, improper training, machine modifications or misuse.

⚠️ WARNING!

Some dust created by power sanding, sawing, grinding, drilling, and other construction activities contains chemicals known to the State of California to cause cancer, birth defects or other reproductive harm. Some examples of these chemicals are:

- Lead from lead-based paints.
- Crystalline silica from bricks, cement and other masonry products.
- Arsenic and chromium from chemically-treated lumber.

Your risk from these exposures varies, depending on how often you do this type of work. To reduce your exposure to these chemicals: Work in a well ventilated area, and work with approved safety equipment, such as those dust masks that are specially designed to filter out microscopic particles.

INTRODUCTION

Foreword

We are proud to offer the Model G0621 Wood/Metal Bandsaw. This machine is part of a growing Grizzly family of fine machinery. When used according to the guidelines set forth in this manual, you can expect years of trouble-free, enjoyable operation and proof of Grizzly’s commitment to customer satisfaction.

We are pleased to provide this manual with the Model G0621. It was written to guide you through assembly, review safety considerations, and cover general operating procedures. It represents our effort to produce the best documentation possible.

The specifications, drawings, and photographs illustrated in this manual represent the Model G0621 as supplied when the manual was prepared. However, owing to Grizzly’s policy of continuous improvement, changes may be made at any time with no obligation on the part of Grizzly. For your convenience, we always keep current Grizzly manuals available on our website at www.grizzly.com. Any updates to your machine will be reflected in these manuals as soon as they are complete. Visit our site often to check for the latest updates to this manual!

Contact Info

If you have any comments regarding this manual, please write to us at the address below:

Grizzly Industrial, Inc.

MODEL G0621
WOOD/METAL CUTTING BANDSAW

Product Dimensions:
- Weight: 236 lbs.
- Length/Width/Height: 30" x 30" x 72½"
- Footprint (Length/Width): 27" x 15"

Shipping Dimensions:
- Type: Cardboard
- Content: Machine
- Weight: 246 lbs.
- Length/Width/Height: 56" x 27" x 16"

Electrical:
- Required Power Source: 220V, Single-Phase
- Switch: ON/OFF Push Button w/Large STOP Paddle
- Cord Length: 6 ft.
- Cord Gauge: 16 gauge
- Recommended Circuit Size: 15 amp
- Plug Included: No
- Recommended Plug: 6-15

Motor:
- Horsepower: 1.25 HP
- Voltage: 220V
- Phase: 3-Phase
- Cycle: 60 Hz
- Type: Induction
- Amps: 4.8
- Speed: 1725 RPM
- Bearings: Sealed and Lubricated
- Power Transfer: Belt Drive

Main Specifications:
- Throat Capacity Left-of-Blade: 13½"
- Maximum Resaw Height: 10"
- Blade Speeds: Variable 150-3000 FPM
- Blade Length: 108"
- Blade Width Range: ½"-1"
- Table Size (Length, Width, Thickness): 16" x 20" x 1 ¼"
- Table Tilt: -5° to 45°
- Table Height from Floor: 38½"
- Wheel Diameter: 14"
- Number of Dust Ports: 1
- Dust Port Size: 2.5"
- Fence Locking Location: Front
**Construction Materials:**

- Wheels........................................................................................................FULLY BALANCED ALUMINUM
- Wheel Covers .................................................................................................STEEL
- Table ..............................................................................................................PRECISION GROUND CAST IRON
- Fence ..............................................................................................................ALUMINUM
- Base ...............................................................................................................STEEL
- Body ...............................................................................................................STEEL
- Paint ...............................................................................................................POWDER COATED

**Other Specifications:**

- Compatible Shop Fox Mobile Base Available from Grizzly ...........................................G7315
- Country Of Origin ..........................................................................................TAINAN
- Sound Rating ..................................................................................................74 dB
- Warranty .........................................................................................................1 Year
- Serial Number Location .................................................................................ID Label on Center of Upper Wheel Cover
- Approximate Assembly & Setup Time .............................................................1.5 Hours
Identification

A. Blade Tension Handle
B. Upper Wheel Cover
C. Blade Guide Elevation Handwheel
D. Blade Tension Scale
E. Blade Tracking Knob
F. Blade Guide Elevation Lock Knob
G. Motor Switch
H. Speed Dial
I. Power Switch
J. Fence
K. Upper Blade Guide Assembly
L. Miter Gauge
M. Table Tilt Lock Knob (1 of 2)
N. Rear Table Support Lock Knob
O. Lower Wheel Adjustment Hub
P. Lower Wheel Cover
Q. Motor
R. Belt Tension Lock Nut
S. Motor Junction Box
T. Dust Hose Access Hole
U. Blade Guard
SECTION 1: SAFETY

⚠️ WARNING
For Your Own Safety, Read Instruction Manual Before Operating this Machine

The purpose of safety symbols is to attract your attention to possible hazardous conditions. This manual uses a series of symbols and signal words intended to convey the level of importance of the safety messages. The progression of symbols is described below. Remember that safety messages by themselves do not eliminate danger and are not a substitute for proper accident prevention measures.

⚠️ DANGER Indicates an imminently hazardous situation which, if not avoided, WILL result in death or serious injury.

⚠️ WARNING Indicates a potentially hazardous situation which, if not avoided, COULD result in death or serious injury.

⚠️ CAUTION Indicates a potentially hazardous situation which, if not avoided, MAY result in minor or moderate injury. It may also be used to alert against unsafe practices.

NOTICE This symbol is used to alert the user to useful information about proper operation of the machine.

⚠️ WARNING
Safety Instructions for Machinery

1. READ THE ENTIRE MANUAL BEFORE STARTING MACHINERY. Machinery presents serious injury hazards to untrained users.

2. ALWAYS USE ANSI APPROVED SAFETY GLASSES WHEN OPERATING MACHINERY. Everyday eyeglasses only have impact resistant lenses—they are NOT safety glasses.

3. ALWAYS WEAR A NIOSH APPROVED RESPIRATOR WHEN OPERATING MACHINERY THAT PRODUCES DUST. Wood dust can cause severe respiratory illnesses.

4. ALWAYS USE HEARING PROTECTION WHEN OPERATING MACHINERY. Machinery noise can cause permanent hearing loss.

5. WEAR PROPER APPAREL. DO NOT wear loose clothing, gloves, neckties, rings, or jewelry that can catch in moving parts. Wear protective hair covering to contain long hair and wear non-slip footwear.

6. NEVER OPERATE MACHINERY WHEN TIRED OR UNDER THE INFLUENCE OF DRUGS OR ALCOHOL. Be mentally alert at all times when running machinery.
WARNING
Safety Instructions for Machinery

7. ONLY ALLOW TRAINED AND PROPERLY SUPERVISED PERSONNEL TO OPERATE MACHINERY. Make sure operation instructions are safe and clearly understood.

8. KEEP CHILDREN AND VISITORS AWAY. Keep all children and visitors a safe distance from the work area.

9. MAKE WORKSHOP CHILDPROOF. Use padlocks, master switches, and remove start switch keys.

10. NEVER LEAVE WHEN MACHINE IS RUNNING. Turn power OFF and allow all moving parts to come to a complete stop before leaving machine unattended.

11. DO NOT USE IN DANGEROUS ENVIRONMENTS. DO NOT use machinery in damp, wet locations, or where any flammable or noxious fumes may exist.

12. KEEP WORK AREA CLEAN AND WELL LIGHTED. Clutter and dark shadows may cause accidents.

14. ALWAYS DISCONNECT FROM POWER SOURCE BEFORE SERVICING MACHINERY. Make sure switch is in OFF position before reconnecting.

15. MAINTAIN MACHINERY WITH CARE. Keep blades sharp and clean for best and safest performance. Follow instructions for lubricating and changing accessories.

16. MAKE SURE GUARDS ARE IN PLACE AND WORK CORRECTLY BEFORE USING MACHINERY.

17. REMOVE ADJUSTING KEYS AND WRENCHES. Make a habit of checking for keys and adjusting wrenches before turning machinery ON.

18. CHECK FOR DAMAGED PARTS BEFORE USING MACHINERY. Check for binding or misaligned parts, broken parts, loose bolts, and any other conditions that may impair machine operation. Repair or replace damaged parts before operation.

19. USE RECOMMENDED ACCESSORIES. Refer to the instruction manual for recommended accessories. Improper accessories increase risk of injury.

20. DO NOT FORCE MACHINERY. Work at the speed for which the machine or accessory was designed.

21. SECURE WORKPIECE. Use clamps or a vise to hold the workpiece when practical. A secured workpiece protects your hands and frees both hands to operate the machine.

22. DO NOT OVERREACH. Maintain stability and balance at all times.

23. MANY MACHINES CAN EJECT WORKPIECES TOWARD OPERATOR. Know and avoid conditions that cause the workpiece to "kickback."

24. ALWAYS LOCK MOBILE BASES (IF USED) BEFORE OPERATING MACHINERY.

25. CERTAIN DUST MAY BE HAZARDOUS to the respiratory systems of people and animals, especially fine dust. Be aware of the type of dust you are exposed to and always wear a respirator designed to filter that type of dust.
Additional Safety Instructions for Bandsaws

1. **BLADE CONDITION.** Do not operate with a dull, cracked, or badly worn blade. Dull blades require more effort to use and are difficult to control. Inspect blades for cracks and missing teeth before each use.

2. **HAND PLACEMENT.** Never position fingers or thumbs in line with the cut. Serious personal injury could occur.

3. **GUARDS.** Do not operate this bandsaw without the blade guard in place.

4. **BLADE REPLACEMENT.** When replacing blades, make sure the teeth face toward the front of the saw and the blade is properly tensioned before operating.

5. **WORKPIECE HANDLING.** Never hold small workpieces with your fingers when cutting. Always support/feed the workpiece with a push stick, table support, vise, or some type of clamping fixture.

6. **CUTTING TECHNIQUES.** Plan your cuts carefully. DO NOT back the workpiece away from the blade while the saw is running. If you need to back the work out, turn the bandsaw OFF and wait for the blade to come to a complete stop. DO NOT twist or put excessive stress on the blade while backing work away.

7. **BLADE SPEED.** Allow blade to reach full speed before cutting.

8. **LEAVING WORK AREA.** Never leave a machine running while unattended. Allow the bandsaw to come to a complete stop before leaving unattended.

9. **FEED RATE.** Always feed stock evenly and smoothly. DO NOT force or twist blade while cutting, especially when sawing tight curves.

10. **MAINTENANCE/SERVICE.** Do all inspections, adjustments, and maintenance with the machine turned OFF and disconnected from the power source.

11. **BLADE CONTROL.** Do not attempt to stop or slow the blade with your hand or a workpiece. Allow the blade to stop on its own.

12. **EXPERIENCING DIFFICULTIES.** If you experience difficulties performing the intended operation, stop using the machine and contact our Technical Support Department at (570) 546-9663.
SECTION 2: CIRCUIT REQUIREMENTS

220V Single-Phase

WARNING
Serious personal injury could occur if you connect the machine to the power source before you have completed the set up process. DO NOT connect the machine to the power source until instructed to do so.

Amperage Draw
The Model G0621 motor draws the following amps under maximum load:

Motor Draw .............................................. 5 Amps

Circuit Requirements
We recommend connecting your machine to a dedicated and grounded circuit that is rated for the amperage given below. Never replace a circuit breaker on an existing circuit with one of higher amperage without consulting a qualified electrician to ensure compliance with wiring codes. If you are unsure about the wiring codes in your area or you plan to connect your machine to a shared circuit, consult a qualified electrician.

Minimum Power Supply Circuit .............. 15 Amps

Plug/Receptacle Type
Recommended Plug/Receptacle...... NEMA 6-15

Grounding
In the event of an electrical short, grounding reduces the risk of electric shock. The grounding wire in the power cord must be properly connected to the grounding prong on the plug; likewise, the outlet must be properly installed and grounded. All electrical connections must be made in accordance with local codes and ordinances.

WARNING
Electrocution or fire could result if this machine is not grounded correctly or if your electrical configuration does not comply with all applicable codes. Ensure compliance by checking with a qualified electrician!

Extension Cords
We do not recommend the use of extension cords. Instead, arrange the placement of your equipment and the installed wiring to eliminate the need for extension cords.

If you find it absolutely necessary to use an extension cord at 220V with your machine:

- Use at least a 14 gauge cord that does not exceed 50 feet in length!
- The extension cord must also contain a ground wire and plug pin.
- A qualified electrician MUST size cords over 50 feet long to prevent motor damage.

Figure 1. NEMA 6-15 plug and receptacle.
SECTION 3: SETUP

Setup Safety

⚠️ WARNING
This machine presents serious injury hazards to untrained users. Read through this entire manual to become familiar with the controls and operations before starting the machine!

⚠️ WARNING
Wear safety glasses during the entire setup process!

⚠️ WARNING
The Model G0621 is a heavy machine. DO NOT over-exert yourself while unpacking or moving your machine—get assistance.

Items Needed for Setup

The following items are needed to complete the setup process, but are not included with your machine:

<table>
<thead>
<tr>
<th>Description</th>
<th>Qty</th>
</tr>
</thead>
<tbody>
<tr>
<td>Straightedge</td>
<td>1</td>
</tr>
<tr>
<td>Level</td>
<td>1</td>
</tr>

<td>1</td>
</tr>
<tr>
<td>Dust Collection System</td>
<td>1</td>
</tr>
<tr>
<td>2½” Dust Hose (length as needed)</td>
<td>1</td>
</tr>
<tr>
<td>2½” Hose Clamp</td>
<td>1</td>
</tr>
</tbody>
</table>

Unpacking

The Model G0621 was carefully packed when it left our warehouse. If you discover the machine is damaged after you have signed for delivery, please immediately call Customer Service at (570) 546-9663 for advice.

Save the containers and all packing materials for possible inspection by the carrier or its agent. Otherwise, filing a freight claim can be difficult.

When you are completely satisfied with the condition of your shipment, you should inventory the contents.
# Inventory

After all parts have been removed from the two boxes, you should have the following items:

## Main Components: (Figure 2) Qty

<table>
<thead>
<tr>
<th>A. Bandsaw Unit</th>

## Fasteners and Tools: (not shown) Qty

- Rubber Feet (Stand) | 4 |
- Hex Bolts 5/16"-18 x 1" (Feet) | 4 |
- Flat Washers 5/16" (Feet) | 4 |
- Hex Nuts 5/16"-18 (Feet) | 4 |
- Hex Bolts 5/16"-18 x 3" (Stand/Bandsaw) | 4 |
- Flat Washers 5/16" (Stand/Bandsaw) | 8 |
- Hex Nuts 5/16"-18 (Stand/Bandsaw) | 4 |
- Hex Bolt 5/8"-16 x 3½" (Positive Stop) | 1 |
- Hex Nut 5/8"-16 (Positive Stop) | 1 |
- Cap Screws M6-1 x 16 (Front Rail) | 2 |
- Front Rail T-Slot Nuts (Front Rail) | 2 |
- Cap Screws M6-1 x 16 (Rear Rail) | 2 |
- Guide Blocks (Blade Guides) | 4 |
- Thumbscrews 1/4"-20 x ½" (Blade Guides) | 4 |
- Phlp Hd Screws 10-24 x 1/4" (Dust Port) | 4 |
- Hex Wrenches 3, 5, 8mm | 1 each |
- Flat Wrench 12/14mm | 1 |

If any nonproprietary parts are missing (e.g. a nut or a washer), we will gladly replace them, or for the sake of expediency, replacements can be obtained at your local hardware store.

---

**NOTICE**

Some hardware/fasteners on the inventory list may arrive pre-installed on the machine. Check these locations before assuming that any items from the inventory list are missing.

Clean Up

The unpainted surfaces are coated with a waxy oil to prevent corrosion during shipment. Remove this protective coating with a solvent cleaner or citrus-based degreaser such as Grizzly’s G7895 Degreaser. For thorough cleaning, some parts must be removed. **For optimum performance from your machine, clean all moving parts or sliding contact surfaces.** Avoid chlorine-based solvents, such as acetone or brake parts cleaner that may damage painted surfaces. Always follow the manufacturer’s instructions when using any type of cleaning product.

**WARNING**
Gasoline and petroleum products have low flash points and can explode or cause fire if used to clean machinery. **DO NOT** use these products to clean the machinery.

**CAUTION**
Many cleaning solvents are toxic if inhaled. Minimize your risk by only using these products in a well ventilated area.

**G7895—Grizzly Citrus Degreaser**
This natural, citrus-based degreaser is a great solution for removing export grease, and it’s much safer to work around than nasty solvents.

Site Considerations

**Floor Load**
Refer to the **Machine Data Sheet** for the weight and footprint specifications of your machine. Some residential floors may require additional reinforcement to support both the machine and operator.

**Placement Location**
Consider existing and anticipated needs, size of material to be processed through each machine, and space for auxiliary stands, work tables or other machinery when establishing a location for your new machine. See **Figure 4** for the minimum working clearances.

**Figure 4.** Minimum working clearances.

**CAUTION**
Children and visitors may be seriously injured if unsupervised. Lock all entrances to the shop when you are away. **DO NOT** allow unsupervised children or visitors in your shop at any time!

**Figure 3.** Grizzly citrus degreaser.

---

G0621 Wood/Metal Bandsaw
Assembly

To assemble the bandsaw:

1. Install the rubber feet into the bottom of the cabinet stand, as shown in Figure 5, with the four 5/16"-18 x 1" hex bolts, four 5/16" flat washers, and four 5/16"-18 hex nuts.

   ![Figure 5. Rubber foot order of installation.]

2. Using a forklift or other powered lifting aid, place the bandsaw on top of the stand.

3. Align the mounting holes on the bandsaw base with those in the stand.

4. Secure the bandsaw to the stand with the four 5/16"-18 x 3" hex bolts, eight 5/16 flat washers, and four 5/16"-18 hex nuts (Figure 6).

   ![Figure 6. Bandsaw mounted to stand.]

5. Thread a 3/8"-16 hex nut half way up the positive stop bolt (Hex Bolt 3/8"-16 x 3 1/2").

6. Thread the positive stop bolt into the trunnion base so it is installed as shown in Figure 7.

   ![Figure 7. Positive stop bolt installed.]

7. Remove the table pin from the table.

8. Fit the table around the blade and rest the table trunnions on the trunnion base, making sure the trunnion bolts extend through the bottom of the trunnion base.

9. Thread the two table trunnion knobs onto the trunnion bolts, as illustrated in Figure 8.

   ![Figure 8. Table installation on trunnion base.]
10. Place the table insert in the center of the table, so it sits flush with the table top surface.

11. Insert the pin into the end of the table slot.

12. Attach the rail brackets to the front of the table with the two M6-1 x 16 cap screws, as shown in Figure 9.

13. Slide the front rail nuts into the T-slot on the underside of the front rail.

14. Fasten the front fence rail to the rail brackets with the two rail bracket knobs, as shown in Figure 10, going into the front rail nuts.

15. Fasten the rear fence rail to the back of the bandsaw with two M6-1 x 16 cap screws, as shown in Figure 11.

16. Pull the fence handle up and place the fence on the front fence rail, as shown in Figure 12.

17. Push the fence handle down to lock the fence in position.
18. Use the tilt bracket knob to secure the table tilt bracket to the bandsaw body, as shown in Figure 13. Tighten the hex nut on the tilt bracket knob against the tilt bracket to secure it in place.

Figure 13. Knob securing table tilt bracket.

19. Thread the handle into the handwheel, then tighten the hex nut against the handwheel to secure it in place.

20. Install the 6" handwheel, as shown in Figure 14, by placing it on the shaft and tightening the set screw in the handwheel.

Figure 14. 6" Handwheel installed.

21. Slide the fence against the blade.

22. Use a sharp pencil to mark the fence rail where the fence scale indicator is pointing. This mark will indicate where to align the 0" mark when you install the scale.

23. Remove the fence from the front rail.

24. Carefully install the scale on the front fence rail, as shown in Figure 15, so the 0" mark on the scale lines up with the pencil mark made in Step 22.

Figure 15. Scale installed on front fence rail.

25. Insert the guide blocks into the upper and lower blade guide assemblies, then secure them with the ¼"-20 x ½" thumbscrews, as shown in Figure 16.

Figure 16. Blade guide installation.

26. Install the dust port, as shown in Figure 17, with the four 10-24 x ¼" Phillips head screws.

Figure 17. Dust port installation.
Dust Collection

⚠️ CAUTION
This saw creates substantial amounts of fine dust while operating. Failure to use a vacuum system can result in respiratory illness.

Connect this machine to a shop vacuum rather than a dust collector. Most dust collectors are not designed to capture metal shavings and doing so may lead to a fire. If you are in doubt about the capabilities of your shop vacuum or dust collector, refer the owner’s manual before connecting it to this machine.

To connect a vacuum hose:

1. Fit the 2\(\frac{1}{2}\)“ dust hose over the dust port, as shown in Figure 18, and secure in place with a hose clamp.

2. Tug the hose to make sure it is snug.

   **Note:** A tight fit is necessary for proper performance.

3. Close stand door and fasten it shut with the stand door knob.

![Figure 18. Dust hose attached to dust port.](image)

Blade Tracking

"Blade Tracking" refers to how the blade rides on the wheels. When tracking correctly, the blade rides in the center of the rim part of the wheels.

Blade tracking is primarily controlled by adjusting the upper wheel tilt. Tracking the blade in this manner is referred to as "Center Tracking," because you tilt the wheel until the blade rides in the center.

Another way to track the blade is known as "Coplanar Tracking." Coplanar tracking involves aligning the wheels so they are parallel and aligned (see Wheel Alignment on Page 42). When wheels are coplanar, vibration and heat are reduced during operation.

The wheels on the Model G0621 are factory aligned, so center tracking is the only adjustment that needs to be performed during setup.

To center track the blade:

1. **DISCONNECT BANDSAW FROM POWER!**

2. Adjust the upper/lower blade guides and support bearings away from the blade.

3. Open the upper wheel cover.

4. Adjust the blade tension by matching the size of the installed blade with the equivalent mark on the blade tension scale (located on the back of the bandsaw).

5. Spin the upper wheel by hand at least three times and watch how the blade rides on the crown of the wheel. Refer to Figure 19 for an illustration of this concept.

   —If the blade rides on the peak of the upper wheel crown, then the bandsaw is already tracked properly and no additional adjustments are needed. Skip to Step 9.

   —If the blade does not ride in the peak of the upper wheel crown, then continue with the next step.
If, during the test run, you cannot easily locate the source of an unusual noise or vibration, stop the machine immediately, then review **Troubleshooting on Page 37**.

If you still cannot remedy a problem, contact our Tech Support at (570) 546-9663 for assistance.

---

**Notice**

Changes in the blade tension may change the blade tracking.

**WARNING**

Wear safety glasses during the entire test run process. Failure to comply may result in serious personal injury.

---

To test run the machine:

1. Read the Safety section beginning on Page 6 and read Basic Controls on Page 24.

2. Connect the machine to the power source.

3. Turn the speed dial counterclockwise as far as it will go.

4. Lift the STOP paddle on the power switch and press the STOP button all the way in (this resets the safety mechanism on the STOP switch).

5. Turn the power **ON** by pressing the green ON button above the STOP paddle. The digital display should light up. If not, make sure the power STOP switch has been reset; otherwise, check the electrical connections and power source.

6. Press the ON button located on the motor control switch, then slowly turn the speed dial clockwise.

7. Listen to and watch for abnormal noises or actions. The machine should run smoothly with little or no vibration or rubbing noises.

---

—Strange or unusual noises must be investigated and corrected before operating the machine further. Always turn **OFF** the machine and disconnect it from power before investigating or correcting potential problems.
Tensioning Blade

A properly tensioned blade is essential for making accurate cuts and is a prerequisite for making many bandsaw adjustments. The blade tension is adjusted by rotating the blade tension lever.

To tension the bandsaw blade:

1. Make sure you have performed the Test Run instructions on the previous page and you are certain that the blade is tracking properly.

2. With the blade tension lever in the down (engaged) position, adjust the blade tension until the mark on the blade tension scale matches the size of blade installed on the bandsaw.

   Note: Because each blade is different and all blades stretch, this scale can only be considered as a general guide.

3. Turn the bandsaw ON.

4. Release the tension one quarter of a turn at a time. When the bandsaw blade starts to flutter, stop decreasing the tension.

5. Now, slowly increase the tension until the blade stops fluttering, then tighten the tension one more quarter of a turn.

6. Turn the bandsaw OFF and read the tension gauge. Use the reading as a guide when tensioning that blade in the future.

   Note: Do not rely on this measurement for long periods of time because the blade will stretch with use.

   NOTICE
   To reduce blade stretching, remove the tension from the blade when not in use.

   NOTICE
   After blade tension and tracking are set correctly, properly adjust the upper/lower support bearings and guide-block assemblies into position before operating machine.

Adjusting Support Bearings

The support bearings are positioned behind the blade to support it during cutting operations. Proper adjustment of the support bearings is an important part of making accurate cuts and also keeps the blade teeth from hitting the blade guides during cuts.

To adjust the support bearings:

1. Make sure that the blade is tracking properly and that it is correctly tensioned.

2. DISCONNECT BANDSAW FROM POWER!

3. Familiarize yourself with the support bearing controls shown in Figure 20.

   Figure 20. Support bearing controls.

4. Remove the blade guard.

5. Loosen the lock bolt shown in Figure 20.
6. Look at the face of the support bearing and rotate the blade guide assembly side-to-side, until the blade is perpendicular with the face of the support bearing, as illustrated in Figure 21.

![Figure 21. Blade should be perpendicular (90°) to the face of the support bearing.](image)

7. Tighten the lock bolt.

8. Loosen the thumbscrew on the support bearing adjustment shaft.

9. Position the support bearing approximately 0.016" away from the back of the blade as illustrated in Figure 22.

![Figure 22. Blade should be aligned approximately 0.016" away from the bearing edge.](image)

10. To quickly gauge this setting, fold a dollar bill in half twice (when folded tightly, four thicknesses of a dollar bill is approximately 0.016"). Place the folded dollar bill between the support bearing and the blade as shown in Figure 23.

![Figure 23. Dollar bill folded twice to make a quick 0.016" gauge.](image)

11. Tighten the thumbscrew to lock the support bearing in place.

**NOTICE**

Whenever changing a blade or adjusting tension and tracking, the upper and lower blade support bearings and guide-blocks must be re-adjusted before cutting operations.
Adjusting Blade Guides

The blade guides provide side-to-side support to help keep the blade straight while cutting. The blade guides adjust in two ways—forward/backward and side-to-side. Properly adjusted blade guides are essential to making accurate cuts.

To adjust the upper and lower blade guides:

1. Make sure the blade tracks properly and is correctly tensioned.

2. DISCONNECT BANDSAW FROM POWER!

3. Familiarize yourself with the blade guide controls shown in Figure 24.

4. Loosen the lateral adjustment thumbscrew.

5. Slide the guide assembly so the front edges of the blade guides are just behind the blade gullets as illustrated in Figure 25.

6. Tighten the lateral adjustment thumbscrew.

7. Loosen the blade guide thumbscrews.

8. Fold a crisp dollar bill in half and place it over the blade (between the blade guides and the blade), as shown in Figure 26.

9. Lightly pinch the dollar bill against the blade with the blade guides, then tighten the blade guide thumbscrews.

10. Remove the dollar bill, then re-install the blade guard.

NOTICE
Make sure the blade teeth will not contact the blade guides during operations or the tooth set on the blade will be ruined.
**NOTICE**

The blade guides should not touch the blade after the dollar bill is removed.

**NOTICE**

Whenever changing a blade or adjusting tension and tracking, the upper and lower blade guides and guide-blocks must be readjusted before cutting operations.

---

**Adjusting Positive Stop**

An adjustable positive stop allows the table to easily return to 90° after tilting.

**To set the positive stop 90° to the blade:**

1. Make sure the blade is correctly tensioned as described in the **Tensioning Blade** instructions on Page 19.

2. **DISCONNECT BANDSAW FROM POWER!**

3. Loosen the two plastic knobs that secure the table to the trunnions.

4. Loosen the hex nut that locks the positive stop bolt in place.

5. Raise the upper blade guide assembly and place a 6” machinist’s square or try-square on the table next to the side of the blade as illustrated in Figure 27. Adjust the positive stop bolt to raise or lower the table until the table is 90° to the blade.

---

**Figure 27. Squaring table to blade.**

6. Secure the plastic knobs and lock the positive stop bolt by tightening the hex nut against the casting. *Ensure that the bolt does not turn by holding it with another wrench while tightening the hex nut.*

---

**Setting Table Tilt Scale to 0°**

The pointer on the table tilt scale must be calibrated in order for the scale reading to be accurate.

**To calibrate the pointer on the table tilt scale:**

1. Make sure the blade is tensioned/tracking correctly and that the table is 90° to the blade (this procedure should be already completed with the **Adjusting Positive Stop** instructions).

2. Loosen the pointer screw.

3. Align the tip of the pointer with the 0° mark on the table tilt scale.

4. Tighten the pointer screw.
Aligning Table

To ensure cutting accuracy when the table is first installed, the table should be aligned so the miter slot is parallel to the bandsaw blade. This procedure works best with a 3/4” blade.

To align the miter slot parallel to the bandsaw blade:

1. Make sure the blade is tracking properly and that it is correctly tensioned.

2. DISCONNECT BANDSAW FROM POWER!

3. Loosen the trunnion bolts that secure the trunnions to the table.

4. Place an accurate straightedge along the blade. The straightedge should lightly touch both the front and back of the blade (the flat part only) without touching the blade teeth.

5. Use a fine ruler to gauge the distance between the straightedge and the miter slot. The distance you measure should be the same at both the front and back ends of the miter slot.

6. Adjust the table as needed until the distance between the blade and miter slot is equal at both ends.

7. Tighten the trunnion bolts.

NOTICE
Adjusting the fence parallel to the miter slot does not guarantee straight cuts. The miter slot may need to be adjusted parallel to the side of the blade. Refer to the Aligning Table instructions.

Aligning Fence

To ensure cutting accuracy, the fence must be parallel with the miter slot.

To align the fence parallel with the miter slot:

1. If the fence is mounted on the left-hand side of the blade, remove it and remount it on the right-hand side of the blade.

2. Adjust the fence face parallel with the edge of the miter slot.

3. Loosen the two cap screws that mount the front rail to the table.

4. Place shims between the front rail and the table as necessary to make the fence parallel with the miter slot.

   Note: Shim stock works well for this, but small pieces of paper can also work in a pinch.

5. Tighten the front rail mounting bolts.
Operation Safety

**WARNING**

Damage to your eyes, lungs, and ears could result from using this machine without proper protective gear. Always wear safety glasses, a respirator, and hearing protection when operating this machine.

**WARNING**

Loose hair and clothing could get caught in machinery and cause serious personal injury. Keep loose clothing and long hair away from moving machinery.

**NOTICE**

If you have never used this type of machine or equipment before, WE STRONGLY RECOMMEND that you read books, trade magazines, or get formal training before beginning any projects. Regardless of the content in this section, Grizzly Industrial will not be held liable for accidents caused by lack of training.

Basic Controls

**Motor Switch:** Starts and stops the motor. Only works after the power switch has been reset and turned **ON**.

**Speed Dial:** Adjusts the speed of the motor, which is displayed in RPM on the digital display.

**Power Switch:** Turns power ON/OFF to the motor switch. OFF button must be reset (by pushing it all the way in) before power will turn **ON** again.

**Blade Tension Handle:** Increases/decreases blade tension when rotated. Quickly releases blade tension when pivoted up.

**Blade Guide Elevation Handwheel:** Raises/lowers the upper blade guide assembly when rotated. The blade guide assembly should always be within 1" of the workpiece when cutting.
Workpiece Inspection (Wood)

Some wood workpieces are not safe to cut or may require modification before they are safe to cut.

Before cutting wood, get in the habit of inspecting all workpieces for the following:

- **Foreign Objects**: Nails, staples, dirt, rocks and other foreign objects are often embedded in wood. While cutting, these objects can become dislodged and hit the operator or break the blade, which might then fly apart. Always visually inspect your workpiece for these items. If they can’t be removed, do NOT cut the workpiece.

- **Large/Loose Knots**: Loose knots can become dislodged during the cutting operation. Large knots can cause blade damage. Choose workpieces that do not have large/loose knots or plan ahead to avoid cutting through them.

- **Wet or "Green" Stock**: Cutting wood with a moisture content over 20% causes unnecessary wear on the blade and yields poor results.

- **Excessive Warping**: Workpieces with excessive cupping, bowing, or twisting are dangerous to cut because they are unstable and can move unpredictably when being cut. DO NOT use workpieces with these characteristics!

- **Minor Warping**: Workpieces with slight cupping can be safely supported if the cupped side faces the table or fence. On the contrary, a workpiece supported on the bowed side will rock during a cut, leading to loss of control.

Overview

The bandsaw is one of the most versatile wood cutting tools in the shop. It is capable of performing the following types of cuts:

**Straight Cuts**
- Miters
- Angles
- Compound Angles
- Resawing
- Ripping
- Crosscutting

**Irregular Cuts**
- Simple and Complex Curves
- Duplicate Parts
- Circles
- Beveled Curves

**Basic Cutting Tips**

Follow these basic tips when operating the bandsaw:

- Keep the upper blade guide assembly adjusted to within 1” of the workpiece.
- Replace, sharpen, and clean blades as necessary. Make adjustments periodically to keep the saw running in top condition.
- Use light and even pressure while cutting. Light contact with the blade makes it easier to follow lines and prevents extra friction.
- Avoid twisting the blade when cutting around tight corners. Allow the blade to saw around the corners.
- Misusing the saw or using incorrect techniques is unsafe and results in poor cuts. Remember—the blade does the cutting with the operator’s guidance.
- Never start a cut with the blade in contact with the workpiece, and do not start a cut on a sharp edge.
- When cutting metal, pay attention to the characteristics of the chips when cutting—they are good indicators of proper blade speed and feed rate. Figure 30 shows the basic chip characteristics and what they mean.

**Figure 30.** Reading chip characteristics.

</tr>
<tr>
<td>Chips are large, curled, blue or brown, or smoking:</td>
<td>Decrease feed rate.</td>
<td></td>
</tr>
</tbody>
</table>

**Table Tilt**

The bandsaw table tilts from -5° left to 45° right.

**To tilt the table:**

1. Loosen the two trunnion knobs underneath the table.
2. Tilt the table to the desired angle. (Refer to the angle gauge on the front table trunnion.)
3. Retighten both table-trunnion knobs.

**NOTICE**

The positive stop must be removed to move the table to the left.

**Guide Post**

The guide post (shown in Figure 31) connects the upper blade guide assembly to the bandsaw. The guidepost allows the blade guide assembly to move up or down to be as close to the workpiece as possible. In order to cut accurately and safely, the bottom of the blade guide assembly must be no more than 1" from the workpiece at all times—this positioning provides the greatest blade support and minimizes the amount of moving blade exposed to the operator.

**Figure 31.** Guide post controls.

To adjust the blade guide assembly on the guide post (the bandsaw must be turned **OFF**):

1. Make sure that the blade tension, blade tracking, support bearing, and blade guides are adjusted correctly.
2. Loosen the guide post lock knob shown in Figure 31.
3. Raise/lower the guide post so the bottom of the blade guide assembly is less than 1" from the top of the workpiece.
4. Lock the guide post with the lock knob.
Ripping

When cutting wood, "Ripping" means cutting with the grain. For plywood or metal, ripping simply means cutting down the length of the workpiece.

To make a rip cut:

1. Adjust the fence to match the width of the cut on your workpiece, then lock the fence in place.
2. Adjust the blade guide assembly to less than 1" away from the workpiece.
3. After all safety precautions have been met, turn the bandsaw ON. Slowly feed the workpiece into the blade and continue with the cut until the blade is completely through the workpiece. Figure 32 shows a typical ripping operation.

   Note: If you cut narrow pieces, use a push stick to protect your fingers.

Crosscutting

"Crosscutting" means cutting across the grain of wood. For plywood or metal, crosscutting simply means cutting across the width of the workpiece.

To make a 90° crosscut:

1. Mark the workpiece on the edge where you want to begin the cut.
2. Adjust the blade guide assembly to less than 1" away from the workpiece and make sure the miter gauge is set to 90°.
3. Move the fence out of the way. Place the workpiece evenly against the miter gauge.
4. Hold the workpiece against the miter gauge and align the mark with the blade.
5. After all safety precautions have been met, turn the bandsaw ON. Slowly feed the workpiece into the blade and continue the cut until the blade is all the way through the workpiece. Figure 33 shows a typical crosscutting operation.

Figure 32. Typical ripping operation.

Figure 33. Typical crosscutting operation.

⚠️ WARNING ⚠️

NEVER place fingers or hands in the line of cut. If you slip, your hands or fingers may go into the blade. ALWAYS use a push stick when ripping narrow pieces. Failure to follow these warnings may result in serious personal injury!
Resawing

"Resawing" (Figure 34) means cutting the workpiece into two or more thinner workpieces.

One of the most important considerations for resawing is blade selection—a wide blade cuts straighter and is less prone to blade lead (see Page 41 for more info on blade lead).

For most applications, use a blade with a hook or a skip tooth style. Choose blades with fewer teeth-per-inch (from 3 to 6), because they offer larger gullet capacities for clearing sawdust, reducing heat buildup and reducing strain on the motor.

![Figure 34. Typical resawing operation.](image)

To resaw a workpiece:

1. Verify that the bandsaw is setup properly and that the table is perpendicular to the blade.

2. Use the widest blade your bandsaw will accept. Note: The blade must also be sharp and clean.

3. Adjust the fence to the desired width of cut, and lock it in place.

4. Support the ends of the board if necessary.

5. Turn the bandsaw ON.

6. Using push paddles and a push stick, maintain workpiece pressure against the fence and table, and slowly feed the workpiece into the moving blade until the blade is completely through the workpiece (see Figure 34).

**NOTICE**
The scale on the front rail will NOT be accurate when using the resaw fence.

**WARNING**
When resawing thin pieces, a wandering blade (blade lead) can tear through the side of the workpiece, exposing your hands to the blade teeth. Always use push blocks when resawing and keep your hands clear of the blade.
Cutting Curves

When cutting curves, simultaneously feed and turn the stock carefully so the blade follows the layout line without twisting. If a curve is so abrupt that it is necessary to repeatedly back up and cut a new kerf, use a narrower blade, a blade with more TPI (teeth per inch), or make more relief cuts.

Relief cuts are made through the waste portion of the workpiece and stop at the layout line. Relief cuts reduce the chance that the blade will be pinched or twisted during the cut.

The list below shows the minimum radius that can be cut by common blade widths.

<table>
<thead>
<tr>

**Figure 35.** Blade width radii.

Stacked Cuts

One of the benefits of a bandsaw is its ability to cut multiple copies of a particular shape by stacking workpieces together and cutting them as one. Before making stacked cuts, ensure that both the table and the blade are properly adjusted to 90°; otherwise, any error will be compounded.

To complete a stacked cut:

1. Align your pieces from top-to-bottom to ensure that each piece has adequate scrap to provide a clean, unhampered cut.
2. Secure all the pieces together in a manner that will not interfere with the cutting. For wood, hot glue on the edges works well, as do brad nails through the waste portion. (Be careful not to cut into the brads or you may break the blade!)
3. On the face of the top piece, mark the shape you intend to cut.
4. Make relief cuts perpendicular to the outline of your intended shape in areas where changes in blade direction could cause the blade to bind.
5. Cut the stack of pieces as though you were cutting a single piece. Follow your layout line with the blade kerf on the waste side of your line as shown in Figure 36.

**Figure 36.** Typical stacked cut.
Blade Selection (Wood Cutting)

Selecting the right blade for the cut requires a knowledge of various blade characteristics.

Blade Length
Measured by the circumference, blade lengths are usually unique to the brand of your bandsaw and the distance between wheels. The Model G0621 uses 108” long blades. Refer to Page 35 for blade replacements.

Blade Width
Measured from the back of the blade to the tip of the blade tooth (the widest point), blade width is often the first consideration given to blade selection. Blade width dictates the largest and smallest curve that can be cut, as well as how accurately it can cut a straight line.

The Model G0621 uses blades from \( \frac{1}{8} \)" to 1" in width. Always pick the size of blade that best suits your application.

- **Curve Cutting**: Use the chart in Figure 35 to determine the correct blade for curve cutting. Determine the smallest radius curve that will be cut on your workpiece and use the corresponding blade width.

- **Straight Cutting**: Use the largest width blade that you own. Narrow blades can cut tight curves (a small radius) but are not very good at cutting straight lines because they naturally wander (blade lead). Large blades excel at cutting straight lines and are less prone to wander.

Tooth Style
When selecting blades, another option to consider is the shape, gullet size, teeth set and teeth angle—otherwise known as “Tooth Style.”

Figure 37 illustrates the three main categories of tooth style:

- **Raker**: This style is considered to be the standard because the tooth size and shape are the same as the tooth gullet. The teeth on raker blades usually are very numerous, have no angle, and produce cuts by scraping the material; these characteristics result in very smooth cuts, but do not cut fast and generate more heat than other types while cutting.

- **Skip**: This style is similar to a raker blade that is missing every other tooth. Because of the design, skip toothed blades have a much larger gullet than raker blades, and therefore, cut faster and generate less heat. However, these blades also leave a rougher cut than raker blades.

- **Hook**: The teeth on this style have a positive angle (downward) which makes them dig into the material, and the gullets are usually rounded for easier waste removal. These blades are excellent for the tough demands of resawing and ripping thick material.
Tooth Pitch
Usually measured as TPI (teeth per inch), tooth pitch determines the size/number of the teeth. More teeth per inch (fine pitch) will cut slower, but smoother; while fewer teeth per inch (coarse pitch) will cut rougher, but faster. As a general rule, choose blades that will have at least three teeth in the material at all times. Use fine pitched blades on harder woods and coarse pitched blades on softer woods.

Blade Care
A bandsaw blade is a delicate piece of steel that is subjected to tremendous strain. You can obtain longer use from a bandsaw blade if you give it fair treatment and always use the appropriate feed rate for your operation.

Be sure to select blades with the proper width, style, and pitch for each application. The wrong choice of blades will often produce unnecessary heat which will shorten the life of your blade.

A clean blade will perform much better than a dirty blade. Dirty or gummed up blades pass through the cutting material with much more resistance than clean blades. This extra resistance also causes unnecessary heat. Grizzly sells resin/pitch dissolving cleaners that are excellent for cleaning dirty blades.

Blade Breakage
Many conditions may cause a bandsaw blade to break. Blade breakage is unavoidable, in some cases, since it is the natural result of the peculiar stresses that bandsaw blades must endure. Blade breakage is also due to avoidable circumstances. Avoidable breakage is most often the result of poor care or judgement on the part of the operator when mounting or adjusting the blade or support guides.

The most common causes of blade breakage are:
- Faulty alignment/adjustment of the guides.
- Forcing or twisting a wide blade around a short radius.
- Feeding the workpiece too fast.
- Dull teeth or damaged tooth sufficient set.
- Overtensioned blade.
- Top blade guide assembly set too high above the workpiece.
- Using a blade with a lumpy or improperly finished braze or weld.
- Continuously running the bandsaw when not in use.
- Leaving blade tensioned when not in use.
- Using the wrong TPI for the workpiece thickness. (The general rule of thumb is 3 teeth in the workpiece at all times.)
**Blade Selection (Metal Cutting)**

Selecting the right blade for the job depends on a variety of factors, such as the type of material being cut, hardness of the material, material shape machine capability, and operator technique.

The chart below is a basic starting point for choosing blade type based on teeth per inch (TPI) for variable tooth pitch blades and for standard raker type bi-metal blades/HSS blades. However, for exact specifications of bandsaw blades, contact the blade manufacturer.

**To select the correct blade TPI:**

1. Measure the material thickness. This measurement is the length of cut taken from where the tooth enters the workpiece, sweeps through, and exits the workpiece.

2. Refer to the "Material Width/Diameter" row of the blade selection chart in Figure 38 and read across to find the workpiece thickness you need to cut.

3. Refer to the "Material Shapes" row and find the shape and material to be cut.

4. In the applicable row, read across to the right and find the box where the row and column intersect. Listed in the box is the minimum TPI recommended for the variable tooth pitch blades.

5. The "Cutting Speed Rate Recommendation" section of the charts offers guidelines for various metals, given in feet per minute (speed FPM) and meters per minute in parenthesis. Choose the speed closest to the number shown in the chart.

---

**Figure 38.** Blade selection and speed chart.
Blade Changes

**WARNING**
Always disconnect power to the machine when changing blades. Failure to do this may result in serious personal injury.

**CAUTION**
All saw blades are dangerous and may cause personal injury. To reduce the risk of being injured, wear leather gloves when handling saw blades.

To replace the blade:

1. **DISCONNECT BANDSAW FROM POWER!**
2. Release the tension lever.
3. Remove the table insert and the table pin. Adjust the upper and lower guide blocks away from the blade.
4. Open the upper and lower wheel covers and slide the blade off both wheels.
5. Rotate the blade 90˚ and slide it through the slot in the table.
6. Slide the blade through the table slot, ensuring that the teeth are pointing down toward the table. If the teeth will not point downward in any orientation, the blade is inside-out. Put on heavy gloves, remove the blade, and twist it rightside-out.
7. Slip the blade through the guides, and mount it over the upper and lower wheels.
8. Apply tension.
9. Turn the tension knob until proper blade tension has been reached according to the blade thickness scale shown in **Figure 39**.
10. Check and adjust the tracking (**Page 17**).
11. Adjust the upper/lower guide blocks and the support bearings (**Pages 19 and 21**).
12. Close the wheel covers.
13. Replace the table insert and table pin, being sure not to use excessive force when inserting the table pin.
Scale Calibration

You may need to recalibrate the fence scale after changing or adjusting the blade, or if the scale is not producing accurate cuts. Recalibrate the fence scale by adjusting the hairline indicator on the fence and testing your adjustment by cutting a piece of scrap wood.

To calibrate the scale:

1. Set the fence anywhere along the scale and locate a piece of scrap wood with at least one straight edge. *Join the edge with a jointer (if needed) to make the edge straight.*

2. Hold the straight edge of the workpiece firmly against the fence, and feed the workpiece through the saw blade with a push stick.

3. Measure the width of the cut workpiece. The width of the workpiece should match the reading on the fence scale.

4. If the reading on the scale is not the same as the width of the cut workpiece, loosen the screws on the magnifying window (*Figure 40*) and adjust it to match the width of the cut workpiece.

5. Tighten the screws; the scale is now correctly calibrated.

*Figure 40. Scale calibration screws.*
SECTION 5: ACCESSORIES

G7315—Super Heavy-Duty Mobile Base
Mobilize your machine with this popular patented mobile base. The unique outrigger-type supports increase stability and lower machine height. This heavy duty mobile base is rated for up to a 1300 lb. capacity.

Figure 41. G7315 SHOP FOX® Mobile Base.

G1928—Bandsaw Handbook
This is the bandsaw bible. Covers step-by-step instructions for basic/advanced cutting techniques. Also includes advanced maintenance, service and troubleshooting procedures, as well as information on bandsaw history/design and blade metallurgy. 320 pages.

SECTION 6: MAINTENANCE

WARNING
Always disconnect power to the machine before performing maintenance. Failure to do this may result in serious personal injury.

Schedule

For optimum performance from your machine, follow this maintenance schedule:

Daily
• Check/correct loose mounting bolts.
• Check/correct damaged saw blade.
• Check/correct worn or damaged wires.
• Correct any other unsafe condition.

Monthly
• Check for V-belt tension, damage, or wear.
• Remove blade and thoroughly clean all built-up sawdust from the rubber tires on the wheels.
• Clean/vacuum dust buildup from inside cabinet and off motor.

Cleaning

Vacuum excess wood chips and sawdust, and wipe off the remaining dust with a dry cloth. If resin has built up, use a resin dissolving cleaner to remove it.

Once a month, remove the blade and thoroughly clean all built-up sawdust from the rubber tires on the wheels.

Lubricating

Protect the unpainted cast iron surfaces on the table by wiping the table clean after every use—this ensures moisture from wood dust does not remain on bare metal surfaces. Keep tables rust-free with regular applications of general lubricants such as G96® Gun Treatment, SLIPIT®, or Boeshield® T-9.

If the table becomes difficult to tilt, remove it and lubricate the trunnions and the slides in the trunnion base with a general lubricant.

Redressing Rubber Tires

As the bandsaw ages, the rubber tires on the wheels may need to be redressed if they harden or glaze over. Redressing the rubber tires improves blade tracking and reduces vibration/blade lead.

If the rubber tires become too worn, then blade tracking will become extremely difficult. At that point, redressing will no longer be effective and the rubber tires must be replaced.

To redress the rubber tires:

1. DISCONNECT BANDSAW FROM POWER!
2. Put on heavy leather gloves.
3. Remove the blade.
4. Clean any built-up sawdust from the rubber tires.
5. Hold 100 grit sandpaper against the rubber tire and rotate the wheel by hand. Only redress the rubber enough to expose a fresh rubber surface.
Review the troubleshooting and procedures in this section to fix or adjust your machine if a problem develops. If you need replacement parts or you are unsure of your repair skills, then feel free to call our Technical Support at (570) 546-9663.

## Troubleshooting

### Motor & Electrical

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Cause</th>
<th>Possible Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Machine does not start or a breaker trips.</td>
<td>1. OFF button has not been reset.</td>
<td>1. Lift paddle and press OFF button down completely until it clicks.</td>
</tr>
<tr>
<td></td>
<td>2. Plug/receptacle is at fault or wired incorrectly.</td>
<td>2. Test for good contacts; correct the wiring.</td>
</tr>
<tr>
<td></td>
<td>4. Wall fuse/circuit breaker is blown/tripped.</td>
<td>4. Ensure circuit size is suitable for this machine; replace weak breaker.</td>
</tr>
<tr>
<td></td>
<td>5. Power supply switched OFF or is at fault.</td>
<td>5. Ensure power supply is switch on; ensure power supply has the correct voltage.</td>
</tr>
<tr>
<td></td>
<td>6. Wiring is open/has high resistance.</td>
<td>6. Check for broken wires or disconnected/corroded connections, and repair/replace as necessary.</td>
</tr>
<tr>
<td></td>
<td>7. Motor ON button or ON/OFF switch is at fault.</td>
<td>7. Replace faulty ON button or ON/OFF switch.</td>
</tr>
<tr>
<td></td>
<td>8. Inverter/Controller box is at fault.</td>
<td>8. Inspect inverter/controller box; replace if faulty.</td>
</tr>
<tr>
<td>Machine stalls or is underpowered.</td>
<td>1. Feed rate/cutting speed too fast for task.</td>
<td>1. Decrease feed rate/cutting speed.</td>
</tr>
<tr>
<td></td>
<td>2. Machine is undersized for the task.</td>
<td>2. Use sharp blade with lower TPI; reduce the feed rate/depth of cut.</td>
</tr>
<tr>
<td></td>
<td>3. Blade is slipping on wheels.</td>
<td>3. Adjust blade tracking and tension to factory specifications.</td>
</tr>
<tr>
<td></td>
<td>5. Plug/receptacle is at fault.</td>
<td>5. Test for good contacts; correct the wiring.</td>
</tr>
<tr>
<td></td>
<td>6. Pulley/sprocket slipping on shaft.</td>
<td>6. Replace loose pulley/shaft.</td>
</tr>
<tr>
<td></td>
<td>7. Motor is at fault.</td>
<td>7. Test/repair/replace.</td>
</tr>
<tr>
<td>Machine has vibration or noisy operation.</td>
<td>1. Motor or component is loose.</td>
<td>1. Inspect/replace stripped or damaged bolts/nuts, and re-tighten with thread locking fluid.</td>
</tr>
<tr>
<td></td>
<td>2. Blade weld is at fault or teeth are broken.</td>
<td>2. Replace blade.</td>
</tr>
<tr>
<td></td>
<td>3. Blade is at fault.</td>
<td>3. Replace warped, bent, or twisted blade; resharpen dull blade.</td>
</tr>
<tr>
<td></td>
<td>4. V-belt worn or loose.</td>
<td>4. Inspect/replace belt.</td>
</tr>
<tr>
<td></td>
<td>5. Pulley is loose.</td>
<td>5. Realign/replace shaft, pulley, setscrew, and key as required.</td>
</tr>
<tr>
<td></td>
<td>7. Machine is incorrectly mounted or sits unevenly.</td>
<td>7. Tighten/replace anchor studs in floor; relocate/shim machine.</td>
</tr>
<tr>
<td></td>
<td>8. Motor fan is rubbing on fan cover.</td>
<td>8. Replace dented fan cover; replace loose/damaged fan.</td>
</tr>
<tr>
<td></td>
<td>9. Motor bearings are at fault.</td>
<td>9. Test by rotating shaft; rotational grinding/loose shaft requires bearing replacement.</td>
</tr>
</tbody>
</table>
### Cutting Operations

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td>2. Blade is dull.</td>
<td>2. Replace blade (Page 33).</td>
</tr>
<tr>
<td>Ticking sound when the saw is running.</td>
<td>1. Blade weld contacting guide/support bearings (a light tick is normal).</td>
<td>1. Use file or stone to smooth and round the back of the blade; slightly loosen the blade guides.</td>
</tr>
<tr>
<td></td>
<td>2. Blade weld may be failing.</td>
<td>2. Inspect and replace blade if necessary (Page 33).</td>
</tr>
<tr>
<td>Blade contacting table insert.</td>
<td>1. Insert installed upside down or backwards.</td>
<td>1. Re-install insert a different way.</td>
</tr>
<tr>
<td></td>
<td>2. Table improperly mounted or aligned.</td>
<td>2. Align table (Page 23).</td>
</tr>
<tr>
<td>Vibration when cutting.</td>
<td>1. Loose or damaged blade.</td>
<td>1. Tighten or replace blade (Page 33).</td>
</tr>
<tr>
<td></td>
<td>2. Sawdust buildup on wheels.</td>
<td>2. Clean all sawdust from rubber tires on wheels.</td>
</tr>
<tr>
<td>Burn marks on the edge of the cut.</td>
<td>1. Too much side pressure when feeding workpiece; blade is binding.</td>
<td>1. Feed workpiece straight into the blade. See Basic Cutting Tips on Page 25.</td>
</tr>
<tr>
<td></td>
<td>2. Blade too wide for size of radius being cut.</td>
<td>2. Install a smaller width blade/increase blade tension. See Page 33 or 19.</td>
</tr>
<tr>
<td>Rough or poor quality cuts.</td>
<td>1. Feeding workpiece too fast.</td>
<td>1. Reduce feed rate.</td>
</tr>
<tr>
<td></td>
<td>2. Blade guides adjusted incorrectly.</td>
<td>2. Re-adjust all blade guides and support bearings.</td>
</tr>
<tr>
<td></td>
<td>2. Low CFM (airflow) from the shop vacuum.</td>
<td>2. Three options:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>—Check dust hoses for leaks or clogs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>—Connect saw to a more powerful shop vacuum.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. Three options:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>—Shake dust hoses.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>—Check belt for proper tension.</td>
</tr>
<tr>
<td>Blade wanders or doesn't cut straight.</td>
<td>1. Blade lead.</td>
<td>1. Refer to Blade Lead on Page 41.</td>
</tr>
<tr>
<td></td>
<td>2. Sawdust buildup on wheels.</td>
<td>2. Clean all sawdust from rubber tires on wheels.</td>
</tr>
<tr>
<td>Cuts are not square (vertically).</td>
<td>1. Table tilt is not adjusted to 0˚ or positive stop has moved out of adjustment.</td>
<td>1. Adjust table tilt to 0˚; readjust positive stop if necessary (Page 22).</td>
</tr>
<tr>
<td></td>
<td>2. Table tilt scale pointer is not calibrated.</td>
<td>2. Calibrate table tilt scale pointer to 0˚ (Page 22).</td>
</tr>
<tr>
<td></td>
<td>3. Table is not square to the blade.</td>
<td>3. Shim table (Page 41).</td>
</tr>
</tbody>
</table>

### Miscellaneous

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Cause</th>
<th>Possible Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blade tension scale is grossly inaccurate.</td>
<td>1. The spring in the blade tension mechanism has lost its &quot;spring.&quot; This is caused by not releasing the blade tension when not in use or frequently over-tensioning the bandsaw.</td>
<td>1. Replace spring in the blade tension mechanism, then take better care of the bandsaw by releasing tension when not in use and not over-tensioning the blade.</td>
</tr>
<tr>
<td>Wheel is noisy.</td>
<td>1. Wheel bearing is worn out.</td>
<td>1. Replace the wheel bearing.</td>
</tr>
<tr>
<td></td>
<td>2. Belt is too tight (lower wheel).</td>
<td>2. Check/loosen the belt tension (Page 39).</td>
</tr>
<tr>
<td>Blade does not track consistently, correctly, or at all.</td>
<td>1. Wheels are not coplanar or aligned with each other.</td>
<td>1. Adjust wheels to be coplanar/aligned with each other (Page 42).</td>
</tr>
<tr>
<td></td>
<td>2. Rubber tires on wheels are worn out.</td>
<td>2. Redress the rubber tires on the wheels (Page 36); replace the rubber tires on the wheels.</td>
</tr>
</tbody>
</table>
Servicing V-Belts

To ensure optimum power transfer from the motor to the blade, the V-belts must be in good condition and operate under proper tension. Check belt tension at least every 3 months—more often if the bandsaw is used daily. V-belts stretch with use and must be periodically re-tensioned.

Replace the V-belts if they are cracked, frayed, or excessively worn.

Accessing V-Belts

1. DISCONNECT BANDSAW FROM POWER!

2. Open the lower wheel cover.

3. Remove the bandsaw blade.

4. Remove the lower wheel by removing the hex bolt at the center of the wheel, then sliding the wheel off the shaft. (The hex nut has left handed threads, so you must turn it clockwise to loosen it.)

5. Take off the pulley cover plate by removing the six Phillips head screws. You now have access to the V-belts for inspection or service (see Figure 43).

Checking V-Belts

1. Follow all previous instructions for Accessing V-Belts.

2. Push the center of each V-belt as illustrated in Figure 44, using moderate force. When tensioned correctly, the deflection should be about ¼”.

   —If the deflection is more than ¼”, then tension that V-belt (see Page 40) before doing Step 4.

3. Use a flashlight to inspect the belt.

   —If a V-belt is cracked, frayed, or glazed, replace it as soon as convenient.

4. Replace the pulley cover, lower wheel, and blade; then close the lower wheel cover.

Figure 43. Pulleys and V-belts.

Figure 44. Belt deflection.
Tensioning/Replacing V-Belts

1. Follow all previous instructions for Accessing V-Belts.

2. Loosen the motor mount bolts shown in Figure 45.

3. Loosen the idler pulley mounting nut behind the cap shown in Figure 46.

—If you only need to retension the V-belts, skip to Step 6.

—If you need to replace the V-belts, continue with Step 4.

4. Pivot the motor and slide the idler pulley to loosen the V-belts.

5. Remove old V-belts and install the new V-belts.

6. Slide the idler pulley down to tighten the lower wheel V-belt, hold pressure on the idler pulley, then tighten the mounting nut.

7. Check the wheel pulley V-belt for correct tension. Retension if necessary before continuing.

8. Pivot the motor to tighten the motor V-belt, hold pressure on the motor, then tighten the motor adjustment bolt.

9. Check the motor V-belt for correct tension. Retension if necessary before continuing.

10. When the belt tension is correct, tighten the motor hinge bolt.

11. Replace the pulley cover, lower wheel, and blade; then close the lower wheel cover.
Shimming Table

To ensure accuracy when cutting stacked workpieces, the table should be 90° to the back of the blade as shown in Figure 47. If the table is not perpendicular to the back of the blade, the table needs to be shimmed.

Shims can be made of any durable object that can be sandwiched between the table and the trunnions. We recommend using shim washers or shim stock because of the wide range of available thicknesses. These items can be purchased at your local hardware store.

![Figure 47. Squaring table to blade back.](image)

**To shim the table:**

1. Make sure that the blade is tracking properly and that it is correctly tensioned.

2. **DISCONNECT BANDSAW FROM POWER!**

3. Loosen the trunnion bolts that secure the trunnions to the table.

4. Place shim stock between the table and the two trunnions to shim the table in the desired direction.

   **Note:** Another way to shim the table is to add washers between the table and the trunnion.

5. Follow the **Aligning Table** instructions on **Page 23** to complete this procedure.

Blade Lead

"Blade Lead" means that the blade does not cut straight when using the fence or miter gauge (see Figure 48). This is a common condition with all bandsaws. Worn or damaged blades may cause lead and replacing them will fix the problem. Still, if your bandsaw is setup correctly and lead occurs, compensate for it by skewing the fence.

![Figure 48. Blade leading away from line of cut.](image)

**To correct blade lead, do the following steps and make a test cut before skewing the fence:**

1. Ensure that you have proper blade tension (refer to **Page 19**).

2. Ensure that the blade guides are adjusted correctly (refer to **Pages 19 & 21**).

3. Ensure that the miter slot or fence is parallel to the blade (refer to **Page 23**).

**To skew your fence:**

1. Cut a piece of scrap wood approximately ¾" thick x 3" wide x 17" long. On a wide face of the board, draw a straight line parallel to the long edge.

2. Slide the fence out of the way and cut free-hand along the line. Stop at the halfway point. Turn the bandsaw OFF and wait for the blade to stop.
Wheel Alignment

Wheel alignment, or "Coplanar Tracking," is one of the easiest ways to ensure you get optimal performance from your bandsaw. When wheels are aligned, or coplanar, the bandsaw cuts straighter. Vibration, heat, and blade wear are also considerably decreased because the blade is automatically balanced on the wheel.

Verifying Upper/Lower Wheels are Coplanar

1. **DISCONNECT BANDSAW FROM POWER!**
2. With the blade on and properly tensioned, hold a straightedge close to the center of both wheels. Make sure the straightedge fully extends across the wheels as shown in Figure 49.

   — If the wheels are coplanar, the straightedge will touch the top and bottom of the outside rims on each wheel.

   — If the wheels are not coplanar, place the straightedge on the lower wheel first (ensuring that it touches both the top and bottom rim), then adjust the tracking knob to see how the upper wheel lines up with the straightedge.

NOTICE
If the table is shifted, the fence will be affected since it is attached.

NOTICE
Lead adjustments will change when new blades are mounted on the saw.

To compensate for lead when making straight crosscuts with the miter gauge, you will need to shift the table:

1. Set the miter gauge to 90° and verify that the gauge body is square to the miter bar, using a 90° square.

2. On a scrap piece of wood, mark a line that is perpendicular to the front edge of the workpiece.

3. Starting where the line begins, cut the board by pushing it through the blade with the miter gauge.

4. Loosen the table mounting bolts, and shift the table to compensate for the blade lead.

5. Repeat Steps 1 & 2 until the blade cuts straight when wood is pushed through with the miter gauge.
If the straightedge does not touch both wheels evenly, the upper wheel needs to be shimmed or the lower wheel needs to be adjusted.

**Shimming Upper Wheel**

1. **DISCONNECT BANDSAW FROM POWER!**

2. Adjust the tracking knob so the top wheel is parallel with the bottom wheel.

3. With the straightedge touching both points of the wheel that does not need to be adjusted, measure the distance away from the incorrect wheel with a fine ruler (see Figure 50). The distance measured with the ruler is the distance the wheel must be corrected.

4. Remove the blade from the saw, then remove the wheel that needs to be shimmed.

5. Determine how many shim washers you need and place them on the wheel shaft.

6. Replace the wheel, the original washers, and the securing nut.

7. Tighten the blade, then check the wheels. (Coplanar wheels may pull out of alignment when the blade is tightened.)

8. When the wheels are coplanar, place a mark on each wheel where you held the straightedge. This assures repeated accuracy every time you adjust your wheels.

**Note:** When wheels are properly coplanar, the blade may not be centered on the crown of the wheel, but it will be balanced. See Figure 51 to better understand coplanarity.

---

**Adjusting Lower Wheel**

Only do this procedure if you cannot make the wheels coplaner with the tracking knob or by shimming the upper wheel. Make sure the upper wheel is adjusted as close as possible to being coplaner with the lower wheel before beginning. Do this procedure with the blade fully tensioned.

**To adjust the lower wheel:**

1. **DISCONNECT BANDSAW FROM POWER!**

2. Loosen the four hex bolts on the lower wheel adjustment hub (Figure 52). These secure the wheel adjustment sleeves.

3. Rotate the wheel adjustment sleeves to move the lower wheel as necessary to make it coplaner with the upper wheel.

4. Tighten the hex bolts to secure the wheel adjustment sleeves in position.

**WARNING**

Safety labels warn about machine hazards and ways to prevent injury. The owner of this machine MUST maintain the original location and readability of the labels on the machine. If any label is removed or becomes unreadable, REPLACE that label before using the machine again. Contact Grizzly at (800) 523-4777 or www.grizzly.com to order new labels.
Grizzly Industrial, Inc. warrants every product it sells for a period of 1 year to the original purchaser from the date of purchase. This warranty does not apply to defects due directly or indirectly to misuse, abuse, negligence, accidents, repairs or alterations or lack of maintenance. This is Grizzly’s sole written warranty and any and all warranties that may be implied by law, including any merchantability or fitness, for any particular purpose, are hereby limited to the duration of this written warranty. We do not warrant or represent that the merchandise complies with the provisions of any law or acts unless the manufacturer so warrants. In no event shall Grizzly’s liability under this warranty exceed the purchase price paid for the product and any legal actions brought against Grizzly shall be tried in the State of Washington, County of Whatcom.

We shall in no event be liable for death, injuries to persons or property or for incidental, contingent, special, or consequential damages arising from the use of our products.

To take advantage of this warranty, contact us by mail or phone and give us all the details. We will then issue you a “Return Number,” which must be clearly posted on the outside as well as the inside of the carton. We will not accept any item back without this number. Proof of purchase must accompany the merchandise.

The manufacturers reserve the right to change specifications at any time because they constantly strive to achieve better quality equipment. We make every effort to ensure that our products meet high quality and durability standards and we hope you never need to use this warranty.

Please feel free to write or call us if you have any questions about the machine or the manual.

Thank you again for your business and continued support. We hope to serve you again soon.
